SUMMARY

Computer Science student at the University of New Brunswick, on the Dean's List for 2025–26 and one of two students awarded the Eldon and Maxine Clair Scholarship. I tutor at UNB's MLC, which shapes how I explain and structure ideas. My work isn't limited to full stack development and agentic AI; I like understanding a wide range of things and using that to build useful products, not just projects.

EDUCATION

University of New Brunswick

Bachelor of Science in Computer Science

Fredericton, NB

September 2024 – Present

- GPA: 3.5 / 4.3
- Additional: Diploma in Technology Management and Entrepreneurship (ongoing)

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, Java, Python, C, SQL

Frontend: React, Next.js, Tailwind CSS, HTML, CSS

Backend: Node.js, Express, REST APIs, JWT authentication, Git Hooks, SQLite

Databases: PostgreSQL, Supabase, MongoDB, MySQL, MariaDB, Row-Level Security

AI & Agentic Systems: Claude API (tool use), LangChain, LangGraph, MCP, RAG, Agentic Workflows

Tools & Platforms: Git, GitHub, GitHub Actions, Vitest, Vercel, npm, Docker

EXPERIENCE

MLC Tutor

University of New Brunswick

Fredericton, NB

September 2026 – Present

- Help students work through course material in drop-in sessions, breaking problems down step by step until the concept actually makes sense to them.
- Also take on private tutoring through the MLC for students who want regular one-on-one support.

Boost Ideation Camp 2026

Participant

Fredericton, NB

January 2026

- Worked in a team to build and pitch Auctus, an AI funding-discovery platform, taking it from idea to working MVP during the camp.

GirlScript Summer of Code

Open Source Contributor

Remote

2026

- Picked up issues across community repositories and got pull requests reviewed and merged with help from project mentors.

Code Social, Winter of Code

Open Source Contributor

Remote

Nov 2025 – Feb 2026

- Contributed through pull requests, code reviews, and issue triage over the three-month program.

PROJECTS

Grymbl | *Python, SQLite, Claude API, Git Hooks, CLI*

2026

- Built a system that instruments file edits, terminal commands, commits, and test runs via shell and git hooks, correlating raw events into episodes through content-hash deduplication and temporal windowing, then reasons over that history the way a senior engineer draws on scars from past incidents.
- Implemented a deterministic triage layer that classifies events locally against a fixed rule set, escalating only meaningful episodes to Claude with stateless, grounded context, enforcing silence as the default and requiring every warning to cite the actual diffs, commits, and history behind it, capped by a daily call budget and per-call token limit.
- Extended the system to reason over coding agents via Claude Code hooks, treating an agent's own narrative as an unverified claim, cross-referencing it against its diffs and exit codes, and surfacing mismatches as findings.
- Modeled decisions and assumptions as first-class, evidence-ranked entities in a structured Experience Graph, distinguishing observed facts from inferred relationships so judgment accumulates over time instead of living only in a person's head.

- Sift** | *TypeScript, LangGraph, Claude API (tool use), Playwright, PostgreSQL, Supabase, Next.js* July 2026 – Present
- Building an agentic AI shopping assistant orchestrated as a LangGraph workflow. Watch agents plan which tools to call (eBay API, Playwright fetchers for Amazon, BestBuy.ca, and Kijiji, price history queries, Reddit signals) and reason over the results to deliver a confident buy or wait verdict, with every claim linked to its source.
 - Designing a trust arbitrage layer that cross references deals on lesser known retailers against trusted platforms, scores seller risk from domain age, reviews, and community sentiment, then recommends the trustworthy option and explains the tradeoff between price and risk.
 - Architecting a tiered model pipeline where a free tier LLM turns free text requests into structured JSON, a deterministic rule engine spots meaningful price events, and Claude is called only on those events with stateless, grounded context, which limits both hallucination and cost.
 - Building a permanent PostgreSQL price history as the agent’s verifiable memory, so it says when it has too little data instead of guessing. Verdicts reach users through Web Push and a Next.js dashboard with Supabase Auth (Google OAuth, email/password).
- Loupe** | *TypeScript, React, Node.js, PostgreSQL, Docker, Claude API (tool use), MCP, Vitest* August 2026 – Present
- Building Loupe, the observability and evaluation platform for Sift’s agents: a TypeScript SDK that instruments every model call and MCP tool call into nested traces with tokens, latency, and cost for each step, surfaced in a React dashboard with waterfall timelines and cost attribution.
 - Architecting an autonomous failure analyst agent that clusters Sift’s eval regressions, queries traces, replays failed runs, and proposes prompt and tool description patches through its own MCP server, then verifies each fix on unseen cases before asking for human approval.
 - Engineering deterministic replay that runs recorded agent trajectories again against stubbed tool outputs, isolating whether a regression came from the model, the prompt, or a tool schema.
 - Designing a regression eval runner that combines code assertions, LLM judge scoring, and MCP tool selection accuracy, gated in CI so no change to Sift ships without passing.
- Auctus** | *Next.js 16, React 19, TypeScript, Supabase, Tailwind CSS* | [Live](#) · [GitHub](#) January 2026 – May 2026
- A Canadian funding-discovery platform where businesses find grants, students find scholarships and bursaries, and professors find research funding, each with their own onboarding and dashboard.
 - Includes profile-based match scoring, a community forum, Postgres row-level security, and a scraper that pulls funding data from official Canadian sources.
- GradTrellis** | *TypeScript, Node.js, PostgreSQL, React* 2026
- Built a degree-audit engine that ingests a student’s start term and completed courses, evaluating them against hand-encoded UNB degree rules to show which requirements are satisfied, in progress, or outstanding.
 - Implemented a constraint-based course allocator that assigns completed courses to the requirements they best satisfy, verified against a brute-force reference implementation in a dedicated test suite.
 - Built a scraper that pulls and caches course listings from the UNB Undergraduate Calendar, with a refresh mode and per-subject scoping to keep degree data current without re-scraping everything.
 - Grounded every audit result in a citation back to the specific calendar rule it came from, so the tool’s output can be checked against the actual source of truth rather than trusted blindly.

AWARDS & SCHOLARSHIPS

- | | |
|--|-------------|
| Dean’s List
<i>University of New Brunswick</i> | 2025 – 2026 |
| <ul style="list-style-type: none"> • Recognized for outstanding academic performance. | |
| Eldon and Maxine Clair Scholarship in Computer Science
<i>University of New Brunswick</i> | 2024 – 2025 |
| <ul style="list-style-type: none"> • Awarded by the UNB Faculty of Computer Science; one of only two students selected. | |
| UNB Alumni Scholarship for International Students
<i>University of New Brunswick</i> | 2024 – 2025 |
| <ul style="list-style-type: none"> • Merit award for international students, recognizing exceptional high school academic performance and extracurricular activities. | |
